Overview of MobileSMS.io Services

Getting Started · https://mobilesms.io/docs/what-is-mobilesms-io/

What is MobileSMS.io?

MobileSMS.io is a privacy-first service that lets you receive **SMS verification codes** using **real SIM-card phone numbers (non-VoIP)**—so you can verify accounts on platforms that often reject VoIP numbers. It's a simple way to keep your **personal number private** while still passing SMS verification.

What we provide (and why it matters)

- **Real SIM, non-VoIP numbers**
  These are carrier-backed mobile numbers (not TextNow-style VoIP), which improves acceptance on sites that block virtual numbers.
- **Two ways to use the service**
  1. **One-Time Use Numbers** (burner-style) for quick, single SMS verifications
  2. **Long-Term Rentals** (dedicated numbers) when you expect re-verification or ongoing access
- **Broad platform coverage**
  MobileSMS.io supports **1,200+ services** (social, email, marketplaces, finance, messaging, and more).

One-time vs long-term: which should you choose?

Choose a One-Time Use Number if you:

- Just need a **single code** to create an account
- Don't want the number tied to you long-term
- Want maximum "use it and move on" privacy

Choose a Long-Term Rental if you:

- Need **multiple codes over time** (logins, security checks, device changes)

- Can’t risk getting locked out later
- Want one number that stays yours during the rental period

MobileSMS.io offers both **single-service rentals** (one platform) and **All Services Premium rentals** (use across multiple platforms), depending on how you work.

Privacy, spam protection, and peace of mind

Using your personal number for signups can lead to spam, data matching, and unwanted exposure. MobileSMS.io helps you keep your real number off your accounts—while still getting the SMS codes you need.

What MobileSMS.io is *not*

To keep expectations clear:

- We’re built for **receiving verification SMS** (not a full phone plan).
- Our service is **one-way SMS** (some platforms may require two-way texting—those won’t work).
- You’re responsible for using numbers in a way that follows platform rules and local laws (no fraud or abuse).

How it works (simple version)

1. Create an account and add credits
2. Pick **one-time** or **long-term** (plus country + service)
3. Use the number for verification and receive your code in the dashboard

Pricing (quick, transparent summary)

- One-time numbers typically **start around $3.50 per SMS received**, and vary by country + platform.
- Long-term rentals are priced by **country + duration**, with live options shown in your dashboard.

Bottom line

If you want **reliable SMS verification** using **real SIM (non-VoIP) numbers**, without handing out your personal phone number, MobileSMS.io is built for exactly that.
